

DBS sanity check: modeled intervention abolishes STN beta (45000 neurons)

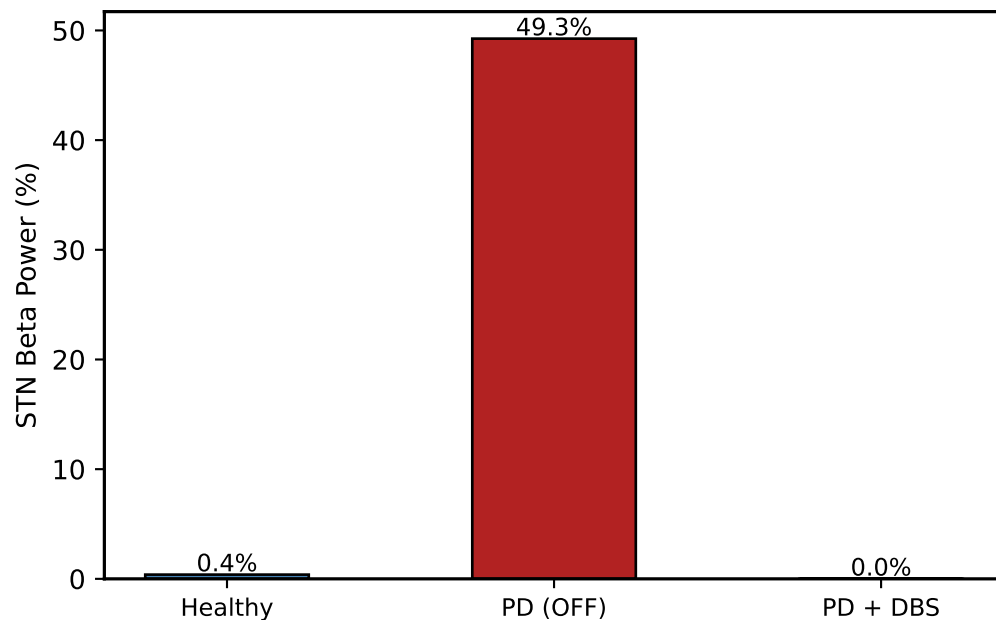

STN power spectrum
Beta: 49.3% -> 0.0%

A. Firing Rates

B. STN Beta Band Power

DBS SANITY CHECK (informational-lesion form)

Intervention:

ISTN: 70 -> 150

g_gpe_stn_mult: 0.114 -> 0.050

Key Results (STN beta):

Healthy: 0.4%

PD (OFF): 49.3%

PD + DBS: 0.0%

Suppression: 100%

Interpretation:

Modeled intervention (raised STN drive + reduced GPe->STN coupling) abolishes beta in the fitted PD network. Demonstrates the modeled knob works; it is NOT a validation of clinical DBS mechanism.
